

1
Unscrew the two screws located left and right on the underside of the saddle.
Please keep screws and washers safe.

7
Next secure the opposite end of the plate AGAIN do NOT tighten 100%. Once gullet is in place and the gullet arch is sitting neatly in the groove of the Genesis saddle tree, then secure the gullet 100% by tightening screws at both ends.

2
Pull away the Velcro closure in the head of the saddle.

8
Re-fit the panel into the point pockets on both sides.

3
Pull the panel down from the point pockets freeing the front of the panel enabling you to see the gullet plate fitted into your Genesis saddle.

9
ENSURE that the panel is forced 100% into point pockets on the panel and re-align the panel securing in place with Velcro that holds the front of the panel to the head of the tree.

4
Remove the two screws at each end of the gullet plate.

10
Re-fit the panel front screws fitting one side at a time and CAREFULLY ensuring that the panel screw goes into the socket on the tree.

5
Gullet plate is now removed.

11
Once one side is secure, pull the other side into place and align and fix in position using the Velcro on the tree and panel front.

6
Put your 'changed' gullet in place and ONLY partially screw in place... do NOT tighten. Partially secure one end only.

12
Re-fit the final front panelscrew again ensuring that the screw goes into the socket on the tree.
